Making Sense of Medical Recommendations for PFAS in the Body

In July 2022, the National Academy of Sciences, Engineering, and Medicine published a report on when a person should be tested for exposure to PFAS and recommended follow-up medical evaluations for those exposed. This factsheet will help you understand the new recommendations and whether you should seek further medical attention. Doctors and nurses may or may not have knowledge about PFAS, so this factsheet also includes background information on the chemicals.

Background

What are PFAS?
Per- and polyfluoroalkyl substances (PFAS) are a class of over 12,000 chemicals that are used to make a variety of products including non-stick cookware, stain-resistant fabrics, and firefighting foams and more. PFAS are called “forever chemicals” because they last in the environment for long periods of time.

Are there health problems associated with PFAS exposure?
We are still learning about how PFAS can affect our health. Some of these chemicals have been linked to health problems including thyroid disease, certain cancers, elevated cholesterol, and effects on the immune system.

What are sources of PFAS exposure?
People can be exposed to PFAS in a variety of ways, but one of the most common sources is drinking water. Levels of PFAS in drinking water vary widely across the U.S. Diet can also be a source of PFAS exposure.

Testing for PFAS Exposure

If you are concerned about potential exposure, a blood test can determine the levels of certain PFAS in your blood at the time of the test. A blood test will not tell you how PFAS got into your body or where it might have come from, and it won’t tell you how long you’ve been exposed.

How can I get a blood test? Where do I find a lab?
Your doctor may be able to help order a test. Providers should use ICD-10 diagnosis code Z13.88, and if ordering a test through Quest, they should use Test Code 39307 and CPT code 82542. If not, they may be able to help with the blood draw, which can then be sent to a lab that does the testing. For more information on how to get tested, visit pfas-exchange.org.

How much does PFAS blood testing cost? Will health insurance cover the cost?
These blood tests can be expensive – they range from $400-$600 depending on the lab and the number of PFAS that are tested for. Health insurance may or may not cover the costs for testing. For more information on the cost of testing, visit pfas-exchange.org.

Do you have your blood test results for PFAS?

**Recommendations for Health Screening for Exposure to PFAS**

The recommendations from the National Academy of Sciences, Engineering, and Medicine is for the total of seven different PFAS in your blood. To see where your results stand, do the following simple calculation:

\[ \text{Total PFAS in blood} = \text{MeFOSAA} + \text{PFHxS} + \text{PFOA} + \text{PFDA} + \text{PFUnDA} + \text{PFOS} + \text{PFNA} \]

All results should be in ng/mL = nanograms of PFAS per milliliter of blood

<table>
<thead>
<tr>
<th>PFAS Level</th>
<th>Recommendations</th>
</tr>
</thead>
</table>
| Greater than 20 ng/mL total PFAS* | - Get cholesterol levels checked (over age 2)  
- During check-ups ask your doctor about:  
  - Thyroid function testing if over age 18  
  - Screening for kidney cancer if over age 45  
  - Screening for testicular cancer and ulcerative colitis if over age 15  
- Get screened for high blood pressure (if pregnant) as well as breast cancer |
| Between 2 and 20 ng/mL total PFAS* | - Get cholesterol levels checked  
  - Once between 9 and 11 years of age  
  - Once every 4 to 6 years for over age 20  
- Get screened for high blood pressure during pregnancy  
- Get screened for breast cancer  
*Note: these screenings are also standard recommendations for medical care* |
| Less than 2 ng/mL total PFAS* | - No additional medical care or screening needed |

*What does this mean for my health?*

Total blood PFAS levels in the middle or upper categories **do not** mean that you have or are going to develop the health problems mentioned in the guidance. This guidance helps you and your doctor be aware of potential risks to your health and well-being.

*What are the costs of the medical screenings?*

Costs will vary. Speak with your doctor about costs and health insurance coverage.

*What else can I do?*

It is important to limit the amount of PFAS at the source, before they wind up in the environment. But everyone can and should still try to reduce their own exposure to PFAS. There are actions you can take like filtering drinking water and avoiding PFAS containing products, that can limit your exposure.
